It is a filamentous ascomycete with a haploid genome (n-7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25X genome coverage. High density colony filters are available upon request.

This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, ¿Saccharomyces servazzii, Zygosaccharomyces rouxii,
Saccharomyces servazzii, Zygosaccharomyces rouxii,
Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces angusts, Debaryomyces hansenii, Pichia sorbitophila,
Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to

XhoI; M. truncatula sterilised seeds were germinated for
72h at 25 C, before transplanting into a 1/3 Epoisses soil:
2/3 calcined Terragreen mix in the presence of onion
root fragments colonized by the arbuscular mycorrhizal
fungus Glomus intraradices (Schenck & Smith, isolate LPAB). The plants were watered every day and twice a week with
a modified nutrient Long Ashton solution without phosphate
but with a high level of nitrate. After 3 weeks RNA was
extracted from whole root systems. cDNA was prepared from
polyA+ enriched RNA. The CDNA was directionally ligated
into Uni-zap XR vector from Stratagene and packaged using
Gigapack Gold packaging extracts. Plasmids containing cDNA

Pred. No. is the number of results predicted by chance to have a scoré greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                    The present sequence represents a cyclohexadepsipeptide synthetase bolypeptide. The specification describes a method for producing a heterologous polypeptide. The method comprises cultivating a mutant of a parent filamentous fungal cell, which produces less cyclohexadepsipeptide than the parent filamentous fungal cell when cultured under the same conditions. The method if used for the production of biologically active compounds e.g. antibiotics.

                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents an enzyme which has cyclosporin synthetase-like activity. This sequence was isolated from Tolypocladium niveum (formerly known as T. inflatum GAMS). This enzyme catalyses the peptide biosynthesis of cyclosporins and structurally related molecules. This sequence may be used for the production of cyclosporin by transforming a vector containing this sequence in to a recombinant host. This allows effective production of antibiotic cyclosporin or its derivatives.
                                                                                                                                                                                                                                                                                                                                            cyclosporin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            654 AVSFDAGTFEVFGALLNGAAL-YPVKKRHVLDAKQFAAFLREQSITTMWLTSPLFNQLAA 712
                                                                                                                                                                                                                                                                                                                                                                                                                           54
                                                                             operon which encodes the multienzyme complex surfactin synthetase (MCSS). Analysis of the sequence showed four regions potentially coding for proteins, a zone upstream of the first ORF contg. the srfA operon promoter and a presumed terminator positioned downstream of the stop codon of the fourth ORF. ORF2 encodes a protein (shown) which can be divided into 3 adjacent repeat regions with internal homology followed by a region (module B) of 500 mmino acids very similar to that of ORF1 and homologous to tyrocidin and gramicidin synthetase subunits I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       336 IQKRSALDGNLLNHLVAFENYPLDQELENGSMEDRL------GF--SIK

to identify proteins used in proliferation, to express these proteins, conditions used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins.  The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.  Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Cformat directly from WIPO at Cformat directly from WIPO at XXX Sequence 2448 AA;	Query Match 10.6%; Score 1713.5; DB 22; Length 2448; Best Local Similarity 28.6%; Pred. An isolated pathway polypeptide useful for e that is a substrate for a synthesis gene cluster hway polypeptide, antibiotic; ng; peptide synthetase module; ne; HPG; antibiotic precursor;

Thu Jun

bloengineering of antiblotic structures. An isolated polypeptide or its encoding nucleic acid sequence is useful for generating derivatives of ramoplanin, for improving production or for producing variants of other antiblotics of the peptide class. The isolated polypeptides are useful for synthesis of ramoplanin in vivo or in vitro, as an adenylation domain in conjunction with other peptide synthesise modules and allowing the incorporation of Thr into a peptide antibiotic precursor, for modifying fatty acid structure and/or enhancing fatty acid incorporation into the peptide antibiotic structure, for production of an hydroxyphenylglycine (HPG) containing peptide antibiotic, for enhancing secretion of ramoplanin or its variants and derivatives, for enhancing uptake of precursors for ramoplanin biosynthesis, for enhancing production of ramoplanin products or its variants or derivatives, to chlorinate HPG of a peptide antibiotic precursor, and for designing specific nucleotide probes and primers for identifying and isolating putative lipdepsipeptide-producing microorganisms. This sequence represents one of the ORF proteins of the ramoplanin producing Actinoplanes sp. microorganism of gene cluster comprising the ORFs is useful as a substrate for the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          706
                                                                                                                                                                                                                                                                                                                                     of
                                                                                                                                                                                                                                                                                                                                                 these regions. At the C terminal end of module 3 there is a region (module A) of 500 amino acids which has no homology with modules 1-3. Although ORFI codes for a protein of unknown function, regions of the protein are found to be highly homlogous to synthetases coded by Tych and GrsA (tyrocidin and gramicidin synthetase subunits I) and with aminoadipyl cystein valine synthetase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       YPFEWLVEDLNIPRDVSRHPLFDTMFSLQNATEGIPAVGDLSLSVQETN--FKIAKFDLT

                                                                                                                                                                                                                 The Bacillus subtilis chromosomal DNA region comprises the srfA operon which encodes the multienzyme complex surfactin synthetase (MCSS). Analysis of the sequence showed four regions potentially coding for proteins, a zone upstream of the first ORF contg. the srfA operon promoter and a presumed terminator positioned downstream of the stop codon of the fourth ORF. ORFI encodes a protein (shown) which can be divided into 3 adjacent repeat regions with an internal homology of ca. 1000 bases, more marked in the second half of these regions. At the C terminal end of module 3 there is a region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SGDAGCVHVTIDGELYQSLRAFCNEHNTTSFVVLLAAFRAAHYRLTAVEDAVIGTPIANR 1380
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a method for the preparation; of a collection of nucleic acids from organisms in a soil sample. The method comprises milling a dried sample to produce microparticles; suspending these in liquid buffer; extraction of nucleic acids from the microparticle; passing nucleic acid-containing solution through a molecular sieve; passing nucleic acid-enriched fractions through an anion exchange chromatography material; and recovering fractions containing purified nucleic acids. The nucleic acids are sources for sequences that encode either operons involved in a metabolic pathway (specifically polyketide synthesis) or polypeptides, particularly for production of therapeutic or agricultural compounds, especially polyketide antibiotics. AABB3971-76 represent type I polyketide synthases encoded by cosmid a2691.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LSERTIVAPEPAAQASVPALSY - - PL - - SAGQQALWFIYRSAPESPAYNIAWIARARGAF 118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence (AAQ48231) is of a vector which includes the delta-(L-alpha-aminoadipyl)-L-cystinyl-D-valine synthase gene. This sequence was transformed into a host cell to express the ACVS product. The protein produced (AAR40227) was then used to manufacture a beta-lactam antibiotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          VILKDSFVFSWMCWSSSSSPD-----EVVRDEAAAA----SGPRCNRFVLLEDMQTKK

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the used in vaccination. The nucleic acids (I) may be used to produce the separation of the manifold and the produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH5509 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

N.B. The present finention specifically claims all the polynucleotide sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4455 to 4472, no sequences are given in the disclosure for SEQ ID NO:4465 to 4472,

                                                                                                                                                                                                                                                                                                                                                                                                                                                        epidermidis; open reading frame; ORF; bacterial infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP315124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

NB. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site.
